WHO'S TALKING TO YOU

An AI builder — and your Visiting Faculty

I build AI at Microsoft

Applied Scientist on M365 Copilot — the AI inside your Office apps

IIT Bombay · Institute Rank 2

Mechanical Engineering (9.90/10) + a minor in Computer Science

7 US patents · 2 research papers

Inventing new things is a real, learnable job

Author + AI newsletter writer

'Beyond Code' (national bestseller); I teach AI online

Taught 20,000+ people

Students & professionals in AI & Data Science — today, you

QUICK SHOW OF HANDS

Hands up if...

...you've used ChatGPT or Gemini

(let's be honest)

...you used it for homework or study THIS week

(no judgement!)

...you've written a line of code — Python, Java, anything

...you've ever TRAINED an AI model yourself

(notice: way fewer hands)

Almost everyone **USES** AI. Few **BUILD** with it.

THE USER

- Types prompts
- Takes the answer as-is
- Stops when it's wrong
- AI is a mystery box

THE BUILDER

- Designs how it works
- Directs it with tools & data
- Knows why it fails — and fixes it
- AI is something they construct

That gap is exactly where your opportunity is.

AI is already doing this — right now

▶ WATCH

Agents that ACT

Books tickets, fills forms & **writes its own code** — on its own.

▶ WATCH

Robots that work

Figure's humanoids helped build **30,000 cars** at BMW.

▶ WATCH

AI-designed medicines

AlphaFold mapped **200M+ proteins** to help design new drugs.

▶ WATCH

Cyclone forecasting

15-day storm forecasts in **8 minutes** — beating supercomputers.

▶ WATCH

India's own AI

Bhashini: real-time translation across **22 Indian languages**.

▶ WATCH

World Cup refereeing

AI draws automatic **offside lines** at the 2026 World Cup.

What ChatGPT really is: a next-word guesser

An **LLM** (Large Language Model) is trained on a huge amount of text.

Its **one job**: predict the most likely **next word** — over and over, until it's written a whole answer.

It isn't looking up facts.

It's pattern-completing from everything it has read.

 **So, it can be confidently WRONG**

A good guess isn't always a true fact.
Use it, then verify the things that matter.

Predicting the next word

“The cat sat on the _____”

AI's best guesses:

Watch an AI learn its patterns — then break it

1 · TRAIN IT

Teach a camera in 60 seconds

Show it a few examples of each class (e.g. Rock / Paper / Scissors), hit Train — it spots the pattern and predicts live.

2 · BREAK IT

Change the orientation a bit...

Uh-oh!

We only showed it ONE kind of orientation of the hand — so it gets confused by a new one.

Output

Let's think like inventors:

1. Whose fault is it — the robot's, or ours?
2. How could we make it SMARTER?

Same idea, bigger scale: An LLM learned patterns from the whole internet — so, when its examples were biased or thin, it's **confidently wrong** too.

Garbage in → garbage out.

The model is the engine. The product is the car.

THE MODEL

= the engine

- **GPT · Claude Opus · Gemini**
- Raw capability — predicts text
- No memory. No tools. No app.
- Built by AI labs

THE PRODUCT

= the car

- **ChatGPT · Claude · Gemini app**
- Wraps the model in a usable app
- Adds memory, tools, search, safety, UI
- What you actually open & use

Builders work with BOTH — and the product layer is where you can create

Agentic AI: from answering to ACTING

A CHATBOT

...answers your question.
Then it stops. You do the rest.

"Here's how you could book it."

AN AGENT

...takes steps, uses tools,
and gets the job DONE.

"Booked. Tickets are in your inbox."

*This is the real frontier — and it's something you can DESIGN.
Here's how...*

The agentic loop: reason → act → observe → repeat

In plain words

- 1 Reason**
The model thinks: what's the next step toward the goal?
- 2 Act**
It calls a TOOL to *actually* do something in the real world
- 3 Observe**
It reads the result, then loops back — repeating until the job is done

The tools it can call:

Web

Data

Files

Code

The Agentic Design Canvas

8 boxes that turn any idea into a buildable AI agent.

Boxes 1–4 = THINK clearly

Boxes 5–8 = ACT responsibly

Who is this for, and what does 'good' mean?

1 • Problem

What real, painful problem?

A great solution to a non-problem helps no one.

"The most annoying part of your week."

2 • User

Who EXACTLY has it?

"Everyone" means no one. Design for one person.

"Your sibling who forgets homework."

3 • Goal

What does success look like?

No finish line → the agent (and you) wander.

"Makes them say: that's exactly it!"

4 • Context

What must it KNOW?

No context = generic, useless answers.

"Your timetable, location, past chats."

What it does — and what happens when it's wrong

5 • Actions

What can it DO?

This is what makes it an agent, not a chatbot.

“Search, book, message, calculate.”

6 • Approvals

When must it ASK a human?

Don't let it spend money or message people freely.

“Ask before paying with mom's UPI.”

7 • Risks

What could go wrong?

Planning failure early = real product, not a toy.

“Books the wrong thing; leaks a secret.”

8 • Recovery

How does it bounce back?

Great systems fail gracefully and recover.

“Undo; ‘let me fix that’; ask a human.”

“DeadlineGuardian” — an agent that kills missed deadlines

1. Problem

Students forget assignment deadlines & lose marks

2. User

A Class 9 student juggling 6 subjects

3. Goal

Zero missed deadlines — calm reminders, not nagging

4. Context

Timetable, school portal, calendar, study habits

5. Actions

Read portal · add reminders · draft a study plan · ping on WhatsApp

6. Approvals

Ask before messaging parents or teachers

7. Risks

Wrong deadline · reading private messages · over-notifying

8. Recovery

Confirm odd deadlines · let them snooze/undo · escalate to a human

Design your own agent in 10 minutes

Teams of 2

Group up with the people around you

Pick a real problem

Something you or your community actually faces

Fill all 8 boxes

Use the printed canvas — think AND act

First 3 hands pitch

60-second pitch to the room, jury-style

10 minutes on the clock

No code needed — just clear thinking.
The best ideas usually come from a problem you genuinely feel.

Remember:

*Fall in love with the **PROBLEM**,
not your first solution.*

Don't compete with AI.
Learn to **direct** it. Be a **builder**.

This week

Build ONE small thing with an AI tool —
OR teach one adult something real about AI.
